Toyota 3SGE Engine Service and Repair Manual Pub. No. RM396E While the block is iron, the cylinder head is made of aluminium alloy. The pentroof combustion chambers are complemented by a crossflow intake and exhaust layout. The spark plug is located in the center of the combustion chamber. The firing order is 1342, with cylinder number 1 adjacent to the timing belt. The 3SGE was designed to be light, the first iteration 3SGELU weighing in at a low 143 kg 315 lb. The forged crankshaft, located within the crankcase, rotates on five aluminium alloy bearings and is balanced by eight weights. Oil holes are located in the middle of the crankshaft to provide oil to the connecting rods, bearing, pistons and other moving components. The intake manifold has four independent ports and benefits from inertia build up to improve engine torque at low and medium speeds. A single timing belt drives the intake and exhaust camshaft. The cam journals are supported on five points between the valve lifters of each cylinder and on the front of the cylinder head, and are lubricated by an oiler port located in the middle of the camshaft. The pistons are made from an aluminium alloy, designed to withstand high temperatures. This is commonly referred to as a "noninterference" engine. Piston pins holding the pistons in place are locked by snap rings. The "Outer Shim Type System" allows for the replacement of the shims without the need to remove the camshaft. To adjust the valve clearance, adjust the shims above the valve lifters. The first compression ring and the oil ring are made of steel, the second compression ring is made of cast iron. Compression rings 1 and 2 prevent exhaust leakage from the combustion chamber while the oil ring works to clear oil off the cylinder walls, preventing excessive oil from entering the combustion chamber. An oil pan baffle is used to ensure that there is sufficient oil available in the oil pan.<http://aucoindeshalles.com/menu/comenda-dishwasher-ac-122-service-manual.xml>
